TO: ALL APPLE-CAT II OWNERS

AUGUST 1982

Do you want to enhance the capabilities and efficiency of your APPLE-CAT II? The new Firmware ROM and 212 Upgrade Module are certain to help. They're available now from your dealer!

Firmware ROM

The Firmware ROM (2K) is an integrated circuit chip containing machine language routines compatible with Basic, Pascal 1.1 and Z-80 Softcard. User-written software applications permit easy use of the APPLE-CAT II's functions with single character commands from the keyboard or from within a program.

Firmware capabilities include automatic logon, storage of phone numbers for redial, terminal and phone modes, remote control, cassette control, speech synthesizer and more. Complete documentation provides instructions and sample programs.

Introducing the 212 APPLE-CAT II

Now you can communicate at 1200 baud full duplex with any Bell 212A compatible data set -- with Novation's new 212 APPLE-CAT II Upgrade Module!

The 212 Upgrade Module (P/N 490412) is another single-card LSI-based modem that is installed in the Apple computer along with your APPLE-CAT II. The two cards constitute the full 212 APPLE-CAT II system (P/N 490502). Installation is easy. The two boards, connected by a ribbon cable, occupy only two slots in the computer. If space is at a premium, the 212 board can be mounted on top of the Apple power supply. The system then occupies only one valuable slot.

All of the operating characteristics and optional features of the APPLE-CAT II have been preserved in the upgrade. In addition, the newly revised software package, Com-Ware II Rev. 4.0, is in the 212 APPLE-CAT II. This provides enhancements such as 80-column capability, CRT memory view, speaker monitor option and language card detection increasing buffer size from approximately 22K to 32K.

See Your Dealer

Read the enclosed brochure. Then visit your local computer store and talk to a dealer. See how Novation is working for you!
